

Development with Maven

Audience Development with Maven Course

The course Maven Development is intended for developers who use Maven for dependency management and for the automatic building and deployment of projects.

Prerequisites Course Using Maven

To participate in the course Maven Development knowledge of and experience with Java and XML is required.

Realization Training Using Maven

The theory is discussed on the basis of the presentation slides and is interspersed with exercises. Demo projects in Maven are used to clarify the concepts. The course material is in English. The course focuses on Maven version 3.

Certification Development with Maven

Participants receive an official certificate Development with Maven after successful completion of the course.

Duration: 2 days

Price: € 1299

[Open Schedule](#)

Content Course Development with Maven

In the course Maven Development participants will learn the skills and knowledge needed to use Maven as an automated build and dependency management tool.

Maven Intro

The course starts with an overview of the problems in project and dependency management, how Maven works and the role of Maven repositories. Explained is how Maven compares to the automatic build tool Ant.

Maven Projects

Next the directory structure of Maven projects and the standard life cycle are discussed. Maven projects can be created using predefined archetypes that have a certain project structure built in from the start. The role of Maven goals and plugins is also covered.

Project Object Model

Then the Project Object Model (POM) with pom.xml is treated. The meaning of the main entries therein such as Group, Artifact and Version are discussed and also a more complex structure with multiple pom files and pom inheritance.

Archetypes

The Maven Archetypes are also part of the program of the course Maven Development. Attention is paid to a number of commonly used archetypes. Also discussed is how you can create archetypes yourself with the Maven Archetype plugin and which are provided with a prototype POM and prototype files.

Repositories

Furthermore Maven Repositories such as the Maven Central repository, Enterprise Repositories, the Local Developer Repository and Remote Repositories are treated. The order in which Maven searches the repositories is discussed and Plugin Repositories are covered as well.

Build Automation

Finally attention is paid to the role of Maven in performing tests, to continuous integration and to release management with Bamboo, Team City or Jenkins.

Modules Course Development with Maven

Module 1 : Maven Intro	Module 2 : Core Concepts	Module 3 : Build Lifecycle
Java Build Tools Intro Desired Features Ant + Ivy Build.xml Build File with Ivy Ivy Dependency Management Maven Build Lifecycle pom.xml Gradle Results Matrix Tools Comparison	What is Maven? Why Maven? Convention over Configuration Maven Directory Structure Project Object Model Maven Project Coordinates POM Structure POM Sections Plugins Archetypes Catalog File Dependencies	What is Build Lifecycle? Standard Lifecycles Key Lifecycle Phases Build Phases and Goals Clean Lifecycle Default or Built Lifecycle Default Lifecycle Phases Site Generation and Reporting Site Lifecycle Site Website Customizing the Lifecycle Package-specific Lifecycles
Module 4 : Profiles	Module 5 : Plugins and Goals	Module 6 : Archetypes
Environment variables User-defined properties Filtering Resources Build Profiles What is a Build Profile? Project Configuration with Profiles Profile Activation Explicit Profile Activation Activation via Maven Settings Activation via Environment Variables Activation via Operating System Activation via Files	What are Maven Plugins? Plugin Types Goals and Plugins Key Plugin Concepts Maven Antrun Plugin Maven Compiler Plugin Exec Maven Plugin Jetty Maven Plugin Eclipse Maven Integration Maven Checkstyle Plugin Findbugs Maven Plugin Maven PMD Plugin	What is an Archetype? Different Archetypes Archetype Generate Command Maven Archetype Archetype Maven Archetype WebApp Simple J2EE Project Maven Archetype Simple Site Creating Archetypes Maven Archetype Plugin Archetype Descriptor Prototype POM Prototype Files
Module 7 : Repositories	Module 8 : Dependency Management	Module 9 : Build Automation
What is a Maven Repository? Enterprise Repositories Local Repository Central Repository Repositories in Super POM Remote Repository Maven Search Sequence Plugin Repositories Repository Management Deploying to Nexus with Maven Performing a Staged Release	What is Dependency Management? Searching Dependencies Transitive Dependencies Dependency Terminology Dependency Scope Optional Dependencies Version Ranges Project Versions Visualizing Dependencies Dependency Conflicts Excluding Transitive Dependencies	Handling Rapid Changes What is a Snapshot? Snapshot Dependency Build Automation Using Snapshots Release Management The Maven Release Plugin Developer Release Workflow Integration with Source Control Continuous Integration Deployment Automation
