

Playwright Test Automation

Audience Course PlayWright Test Automation

The course PlayWright Test Automation is intended for testers, developers and QA engineers who want to use PlayWright for end-to-end testing of web applications.

Prerequisites PlayWright Test Automation

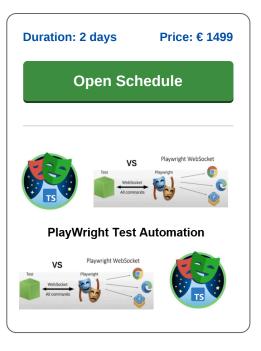

Basic knowledge of programming in for example JavaScript, TypeScript or Python. Some experience with test automation is beneficial for understanding.

Realization Training PlayWright Test Automation

Demos and case studies led by the trainer are interchanged with presentations and practical exercises.

Certificate PlayWright Test Automation

After successfully completing the course, participants will receive a certificate of participation in PlayWright Test Automation.

Content Course Playwright Test Automation

In the course Playwright Test Automation, participants learn to use the Microsoft Playwright Framework to automatically test the UI of modern web applications. Playwright enables the creation of reliable, fast, and scalable UI tests.

Intro Playwright

The course starts with an introduction to Playwright, a modern web testing tool. It compares Playwright with Selenium and Cypress, explains how to install it, and demonstrates browser contexts, auto-waiting, introspection events, and web-first assertions. Participants also learn about Playwright Inspector, multi-language support, and using the tool efficiently.

Writing Tests

In this module, participants learn how to write tests using Playwright's syntax and structure. The difference between using the test library and raw API is discussed. Various locator strategies including CSS, XPath, and role-based locators are explained. The module also covers writing assertions, using the trace viewer, and debugging with VS Code.

UI Interactions

This module focuses on simulating user interactions such as button clicks, text inputs, and handling checkboxes and dropdowns. It also covers modal dialogs, alerts, pop-ups, file uploads, and working with multiple browser contexts and network requests.

Fixtures and Hooks

Participants learn what fixtures are and how to use them to set up a consistent test environment. Built-in and custom fixtures are covered, including overriding fixtures and using setup and teardown. The module also explains the differences between fixtures and hooks like beforeEach and afterEach.

API Testing

This module teaches participants how to perform API testing with Playwright. They will make GET, POST, PUT, and DELETE requests, insert headers, and validate JSON payloads and response codes. It also covers combining API and UI tests, parallel execution, and testing authentication flows.

Advanced Topics

The course concludes with advanced topics such as test parameterization, using CSV files, passing environment variables through .env files, and managing timeouts and retries. Participants also learn to generate test reports and snapshots and perform visual regression testing.

Modules Course Playwright Test Automation

Module 1: Intro Playwright	Module 2: Writing Tests	Module 3: UI Interactions
What is Playwright?	Test Syntax and Structure	Page Interactions
Comparison with Selenium	Test versus Raw API	Button Clicks
Comparison with Cypress	Out of Process Running	Text Insertions
Installing Playwright	Locating Elements	Check and Radio Buttons
Browser Contexts	CSS Locators	Working with Dropdowns
Waiting for Elements	XPath Locators	Modal Dialogs
Auto Wait	Role-based Locators	Handling Alerts
Introspection Events	Page Interactions	Handling Pop-Ups
Language Bindings	Writing Assertions	Multiple Browser Contexts
Playwright Inspector	Trace Viewer	Handling File Uploads
Web-First Assertions	VS Code Debugger	Network Requests
Module 4: Fixtures and Hooks	Module 5: API Testing	Module 6: Advanced Topics
Module 4: Fixtures and Hooks What are Fixtures?	Module 5: API Testing Making API Requests	Module 6: Advanced Topics Test Parameterization
	-	
What are Fixtures?	Making API Requests	Test Parameterization
What are Fixtures? Establish the Environment	Making API Requests GET and POST Requests	Test Parameterization Tests via CSV files
What are Fixtures? Establish the Environment Built-in Fixtures	Making API Requests GET and POST Requests PUT and DELETE Requests	Test Parameterization Tests via CSV files Passing Environment Variables
What are Fixtures? Establish the Environment Built-in Fixtures Benefits of Fixtures	Making API Requests GET and POST Requests PUT and DELETE Requests Validating Response Codes	Test Parameterization Tests via CSV files Passing Environment Variables .env Files
What are Fixtures? Establish the Environment Built-in Fixtures Benefits of Fixtures Custom Test Fixtures	Making API Requests GET and POST Requests PUT and DELETE Requests Validating Response Codes Inserting Request Headers	Test Parameterization Tests via CSV files Passing Environment Variables .env Files Handling Timeouts
What are Fixtures? Establish the Environment Built-in Fixtures Benefits of Fixtures Custom Test Fixtures Overriding Fixtures	Making API Requests GET and POST Requests PUT and DELETE Requests Validating Response Codes Inserting Request Headers Validating JSON Payloads	Test Parameterization Tests via CSV files Passing Environment Variables .env Files Handling Timeouts Failures and Retries
What are Fixtures? Establish the Environment Built-in Fixtures Benefits of Fixtures Custom Test Fixtures Overriding Fixtures Setup and Teardown	Making API Requests GET and POST Requests PUT and DELETE Requests Validating Response Codes Inserting Request Headers Validating JSON Payloads Validating Response Codes	Test Parameterization Tests via CSV files Passing Environment Variables .env Files Handling Timeouts Failures and Retries Test Reports
